

Early Detection Saves Lives

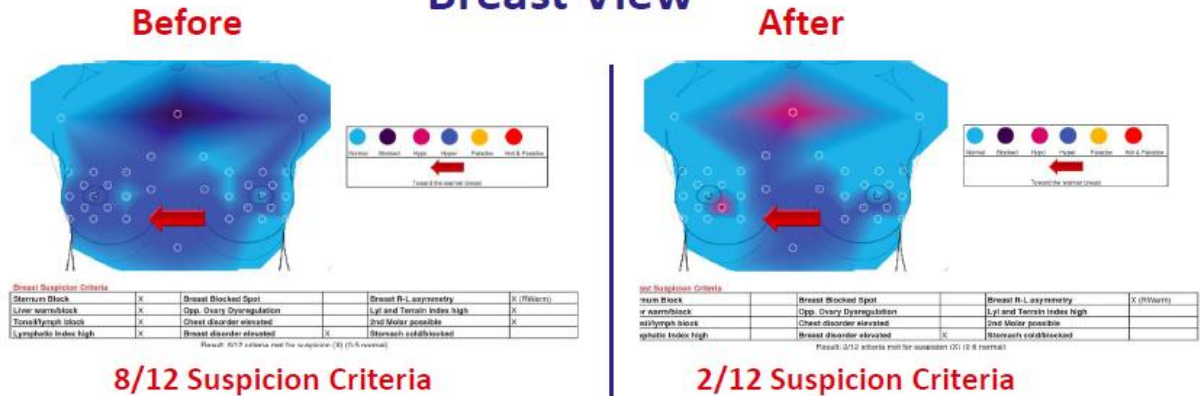

THE ALFASIGHT 9000™ Whole Body Thermometry System

- Digitized Temperatures; Disease Signature-Recognition Algorithms. Eliminates Bias.
- 30,000+ Patient Database with Correlations to Radiology, Clinical and Laboratory Tests
- Non-Invasive, No Radiation
- Monitor Treatment Efficacy & Patient Progress
- Early Detection for Early Intervention
- Instant Patient Reports with Priorities and Recommendations that Guide Treatment

Thermography is a non-invasive, thirty minute test. It does not use radiation which is known to cause cancer. It does not compress breast tissue which is dangerous to do if cancer is present and also uncomfortable. It is better than mammography at early detection of breast abnormalities.

This screening tool can identify potential issues related to breast cancer at an early stage where there is a high percentage of a complete cure. **Thermography** can spot suspicious tissue changes 10 years before it is detected by mammography.

Breast View

Chemical and blood vessel activity in the area surrounding developing breast cancer is almost always higher than in the normal breast. When a tumor is forming, it develops its own blood supply to feed its accelerated growth and this increased blood flow can increase the surface temperature of the breast. Pre-cancerous tissues can start this process well in advance of the cells becoming malignant.

Mammography has not proved to be a flawless screening tool. It has a difficult time giving a good reading in women with dense breasts or implants, exposes women year after year to radiation and compresses tissue which in the event of cancer, is unsafe.

The August 2007 issue of Radiology reports that mammography centers across the country in the US are closing because the false negative rates of mammography range is as high as 40%.

BENEFITS OF THERMOGRAPHY

Thermography is useful for evaluating other parts of the body as well. **Thermography** is an excellent tool in sports medicine and pain management because it can map inflammation from neurological or musculoskeletal dysfunction. It can also assist in early warning markers for prostate cancer. We can even see changes in the area of the abdomen which could indicate inflammatory bowel disease like colitis, ileitis or Crohn's disease.

Tell your friends about THERMOGRAPHY *The Safer Alternative*

- No X-rays or radiation
- More comfortable—no painful breast compression
- No problem with dense fibrous breasts
- No problem with breast implants
- Detects inflammatory reactions in the breasts
- Detects potentially cancerous tissue years before mammography can
